Post-EDC Wound Care Instructions

Today you had an electrodesiccation and curettage procedure done at The Dermatology Clinic.

Leave the bandage in place for 24 hours. After 24 hours, remove the bandage and clean with gentle soap and water. Please clean the site with soap and water at least daily. Apply Vaseline or Aquaphor ointment to the site at least once or twice daily.

After the first 24 hours, you may leave the site uncovered or, if you choose, you may cover it with a new bandage.

If a scab develops over the biopsy site, please do not pick it off.

Please keep the area protected from the sun with sun screen or protective clothing, such as a hat.

If you develop increasing pain, redness, or drainage at the site, or any other concerns, please contact us.

Thank you !
